

FishR 101 – Functions

Homework

Instructor: Emily Markowitz (Emily.Markowitz@noaa.gov)

February 09, 2021

Contents

1	If-else statements	2
1.1	Performance: was this a good trawl?	2
2	For loops	2
2.1	Improve the following code by putting it into a for loop!	2
3	Extra Credit	3

Questions:

First, load your libraries!

```
library(tidyverse)
library(here)
```

NOTE: For this homework, also refer to the PDF version. There are helpful graphics included in the PDF version!

1 If-else statements

1.1 Performance: was this a good trawl?

If the weather is **excellent** or **good**, the performance of the trawl is 0 if the weather is **fair**, the performance of the trawl is 1 if the weather is **poor**, the performance of the trawl is -1

Write the following as an:

- `if()` / `if()}{else}{}` / `if()}{else if()}{}` statement (whichever you see fit),
- in an `ifelse()` function,
- using `dplyr::if_else()`, and
- using `dplyr::case_when()`

Test your scripts with for the first two bullets (if-else statement, `ifelse()`)

```
weather <- "good"
```

Test your scripts with for the second - fourth bullet (`ifelse()`, `if_else()`, `case_when()`)

```
dat<-data.frame(weather = c("excellent", "good", "fair", "poor"))
```

Which do you think is the most sensible approach?

2 For loops

2.1 Improve the following code by putting it into a for loop!

Let's use a for loop to estimate the average the result of a roll of a die.

```
nsides = 6
ntrials = 1000
```

A non-loop version of this for the first variable would be:

```
trials <- c()
j <- 1
trials <- c(trials, sample(1:nsides,1))
trials
```

```
## [1] 1
```

once you write your loop, you can use the following to calculate the average the result of a roll of a
`mean(trials)` *# NOTE: because we are taking a random sample (sample()) you will not get the same answer*

```
## [1] 1
```

3 Extra Credit

Vectorize the below for loop from the lecture into 4 tidyverse lines:

```
EBS_haul_table<-read_csv(here::here("data", "ebs_2017-2018.csv"))

EBS_summary<-EBS_haul_table %>% # use EBS data to create object "EBS_summary"
  dplyr::group_by(YEAR, STRATUM, COMMON) %>% # Group by YEAR, STRATUM, COMMON for next command
  dplyr::summarise(WTCPUE_sum = sum(WTCPUE, na.rm = TRUE)) # sum WTCPUE across grouped items above

unique_yr_strat<-EBS_summary %>%
  dplyr::select("YEAR", "STRATUM") %>%
  distinct()

unique_yr_strat
```

YEAR	STRATUM
